AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

## SCOPE

### 1-1-0      Purpose

#### **\*\*ON A/C A340-500 A340-600**

##### Introduction

###### 1. General

The A340-500/-600 AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING (AC) manual is issued for the A340-500 and A340-600 basic versions to provide necessary data to airport operators, airlines and Maintenance/Repair Organizations (MRO) for airport and maintenance facilities planning.

This document is not customized and must not be used for training purposes.

The A340 is part of an integrated family sharing the same modern technology as the A330 and maintaining the commonality that is integrated into the Airbus Fly-by-Wire family. It has undergone a program of continuous improvement and still delivers the value that airline customers expect, as the A340 has over 50 customers and operators with more than 350 A340s flying to over 150 airports every week.

The different models of the A340 family can carry from 250 to 440 passengers and are operating on some of the world's longest routes.

A stand-out benefit of the four-engine A340 is that it does not require any ETOPS certification. This allows quick start-up of long-haul operations. It also has good 'hot and high' capability at airports that would be off-limits to other aircraft.

The A340 has one of the quietest and most comfortable cabins in the sky, with state-of-the-art LED (Light Emitting Diode) lighting, mood styles of lighting and AVOD IFE systems.

The A340 combines good capability, economics and passenger product in one package.

## 1. List of Abbreviations

A/C	Aircraft
ACN	Aircraft Classification Number
ACR	Aircraft Classification Rating
AMM	Aircraft Maintenance Manual
APU	Auxiliary Power Unit
B/C	Business Class
C/L	Center Line
CBR	California Bearing Ratio
CC	Cargo Compartment
CG	Center of Gravity
CKPT	Cockpit
CLG	Centerline Landing Gear
E	Young's Modulus
ELEC	Electric, Electrical, Electricity
ESWL	Equivalent Single Wheel Load
F/C	First Class
FAA	Federal Aviation Administration
FDL	Fuselage Datum Line
FR	Frame
FSTE	Full Size Trolley Equivalent
FWD	Forward
GPU	Ground Power Unit
GSE	Ground Support Equipment
HYD	Hydraulic
ICAO	International Civil Aviation Organisation
IDG	Integrated Drive Generator
ISA	International Standard Atmosphere
L	Radius of relative stiffness
LCN	Load Classification Number
LD	Load Device
LD	Lower Deck
L/G	Landing Gear
LH	Left Hand
LPS	Last Pax Seating

MAC	Mean Aerodynamic Chord
MAX	Maximum
MD	Main Deck
MIN	Minimum
MLG	Main Landing Gear
NLG	Nose Landing Gear
OAT	Outside Air Temperature
PAX	Passenger
PB/D	Passenger Boarding/Deboarding
PBB	Passenger Boarding Bridge
PCA	Portland Cement Association
PCN	Pavement Classification Number
PCR	Pavement Classification Rating
PRM	Passenger with Reduced Mobility
RH	Right Hand
ULD	Unit Load Device
US	United States
WV	Weight Variant
Y/C	Economy Class

## 2. Design Weight Terminology

- Maximum Design Ramp Weight (MRW):  
Maximum weight for ground maneuver (including weight of taxi and run-up fuel) as limited by aircraft strength and airworthiness requirements. It is also called Maximum Design Taxi Weight (MTW).
- Maximum Design Landing Weight (MLW):  
Maximum weight for landing as limited by aircraft strength and airworthiness requirements.
- Maximum Design Take-Off Weight (MTOW):  
Maximum weight for take-off as limited by aircraft strength and airworthiness requirements.  
(This is the maximum weight at start of the take-off run).
- Maximum Design Zero Fuel Weight (MZFW):  
Maximum permissible weight of the aircraft without usable fuel.
- Maximum Seating Capacity:  
Maximum number of passengers specifically certified or anticipated for certification.
- Usable Volume:  
Usable volume available for cargo, pressurized fuselage, passenger compartment and cockpit.
- Water Volume:  
Maximum volume of cargo compartment.
- Usable Fuel:  
Fuel available for aircraft propulsion.

## AIRCRAFT DESCRIPTION

### **2-1-1 General Aircraft Characteristics Data**

##### General Aircraft Characteristics Data

#### **\*\*ON A/C A340-600**

1. The following table provides characteristics of A340-600 Models, these data are specific to each Weight Variant:

Aircraft Characteristics		
	WV000	WV001
Maximum Taxi Weight (MTW)	366 200 kg (807 333 lb)	369 200 kg (813 946 lb)
Maximum Ramp Weight (MRW)	365 000 kg (804 687 lb)	368 000 kg (811 301 lb)
Maximum Take-Off Weight (MTOW)	256 000 kg (564 383 lb)	259 000 kg (570 997 lb)
Maximum Landing Weight (MLW)	242 000 kg (533 519 lb)	245 000 kg (540 132 lb)
Maximum Zero Fuel Weight (MZFW)		
Usable Fuel Capacity (density = 0.785 kg/l)	195 010 l (51 516 US gal)	
		153 082 kg (337 488 lb)

Aircraft Characteristics			
	WV101	WV102	WV103
Maximum Taxi Weight (MTW)	381 200 kg (840 402 lb)	369 200 kg (813 946 lb)	366 200 kg (807 333 lb)
Maximum Ramp Weight (MRW)	380 000 kg (837 756 lb)	368 000 kg (811 301 lb)	365 000 kg (804 687 lb)
Maximum Take-Off Weight (MTOW)	265 000 kg (584 225 lb)	259 000 kg (570 997 lb)	265 000 kg (584 225 lb)
Maximum Landing Weight (MLW)	251 000 kg (553 360 lb)	245 000 kg (540 132 lb)	251 000 kg (553 360 lb)
Maximum Zero Fuel Weight (MZFW)			
Usable Fuel Capacity	198 139 l (1) - 208 939 l (2)		

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

Aircraft Characteristics			
	WV101	WV102	WV103
(density = 0.785 kg/l)		(52 343 US gal (1) - 55 196 US gal (2))	
		155 539 kg (1) - 164 017 kg (2) (342 905 lb (1) - 361 595 lb (2))	

- (1) Without forward ACT  
(2) With forward ACT

2. The following table provides characteristics of A340-600 Models, these data are common to each Weight Variant:

Aircraft Characteristics	
Standard Seating Capacity	384
Pressurized Fuselage Volume (A/C non equipped)	1 305 m <sup>3</sup> (46 086 ft <sup>3</sup> )
Passenger Compartment Volume	557 m <sup>3</sup> (19 670 ft <sup>3</sup> )
Cockpit Volume	12 m <sup>3</sup> (424 ft <sup>3</sup> )
Usable Volume, FWD CC (Based on LD3)	104 m <sup>3</sup> (3 672 ft <sup>3</sup> )
Usable Volume, AFT CC (Based on LD3)	78 m <sup>3</sup> (2 754 ft <sup>3</sup> )
Usable Volume, Bulk CC	19.7 m <sup>3</sup> (695 ft <sup>3</sup> )
Water Volume, FWD CC	143 m <sup>3</sup> (5 050 ft <sup>3</sup> )
Water Volume, AFT CC	102.3 m <sup>3</sup> (3 612 ft <sup>3</sup> )
Water Volume, Bulk CC	22.7 m <sup>3</sup> (802 ft <sup>3</sup> )

1. This section provides the height of various points of the aircraft, above the ground, for different aircraft configurations.

Dimensions in the tables are approximate and will vary with tire type, weight and balance and other special conditions.

The dimensions are given for:

- A light weight, for an A/C in maintenance configuration with a mid CG,
- An aircraft at Maximum Ramp Weight with a FWD CG and an AFT CG,
- Aircraft on jacks, FDL at 7.20 m (23.62 ft).

NOTE : Passenger and cargo door ground clearances are measured from the center of the door sill and from floor level.

**2-8-0      Escape Slides****\*\*ON A/C A340-500 A340-600**Escape Slides

## 1. General

This section provides the location of the cabin escape facilities and their related clearances.

**\*\*ON A/C A340-500**

## 2. Location

Escape facilities are provided at the following locations:

## A. Door Escape Facility

- One dual lane escape slide-raft at each passenger/crew door (total six)
- One single lane escape slide at each emergency exit door (total two).

The slides are installed in a container in the lower part of the door.

**\*\*ON A/C A340-600**

## 3. Location

Escape facilities are provided at the following locations:

## A. Door Escape Facility

- One dual lane escape slide-raft at each passenger/crew door (total six)
- One dual lane escape slide-raft at each emergency exit door (total two).

The slides are installed in a container in the lower part of the door.

## B. Off-Wing Escape Facility

- One single lane escape slide at each overwing emergency-exit door (total two).

The escape slide is installed in the left and right belly fairing above, and AFT of the wing trailing edge, between FR53.2 and FR53.4.

**2-9-0      Landing Gear****\*\*ON A/C A340-500 A340-600**Landing Gear Maintenance Pits

## 1. General

The minimum maintenance pit envelopes for the main landing gear shock absorber removal are shown in Figures 1 and 2.

All dimensions shown are minimum dimensions with zero clearances.

The dimensions for the pits have been determined for these design factors:

- The length and width of the pits allow the gear to rotate as the weight is taken off the landing gear
- The depth of the pits allow the shock absorber to be removed when all the weight is taken off the landing gear.

Dimensions for elevators and associated mechanisms must be added to those in Figures 1 and 2.

## A. Elevators

These can be either mechanical or hydraulic. Elevators are used to:

- permit easy movement of persons and equipment around the main landing gears
- to lift and remove landing gear assemblies out of the pits.

## B. Jacking

The aircraft must be in position over the pits to put the gear on the elevators. Jacks must be installed and engaged with all the jacking points (Ref. Section 2-14 for Jacking).

Jacks must support the total aircraft weight, i.e. when the landing gears do not touch the elevators on retraction/extension tests.

When tripod support jacks are used, the tripod-base circle radius must be limited because the locations required for positioning the jacks are close to the sides of the pits.

FIGURE-2-9-0-991-005-B01

**\*\*ON A/C A340-500 A340-600**Landing Gear

## 1. General

The aircraft has:

- Two Main Landing Gears (MLG) with four wheel bogie assembly and related doors,
- A Centerline Landing Gear (CLG) with four wheel bogie assembly and related doors,
- A Nose Landing Gear (NLG) with twin wheel assembly and related doors.

The main landing gears are located under each wing and retract sideways towards the fuselage centerline.

The centerline landing gear is located on the belly and retract forward into a bay in the fuselage. The nose landing gear retracts forward into a fuselage compartment below the cockpit.

The retraction and extension of the landing gears and landing gear doors are operated hydraulically and mechanically. The control, sequence and indication are electrical. In abnormal operation, the landing gears can be extended by gravity.

For the dimensions of the landing gear footprint and tire size, refer to 07-02-00.

## 2. Main Landing Gear and Doors

Each MLG has a leg assembly and a four-wheel bogie beam. The MLG leg includes a shortening mechanism, a bogie pitch trimmer and an oleo-pneumatic shock absorber. In-flight, with the MLG extended, the bogie is held in a trailing condition (rear wheels low) by an articulation linkage and a pitch trimmer. The folding sidestay is locked mechanically by a lockstay (which is operated by the downlock actuator) when the MLG is fully extended.

Each MLG bay has the following doors:

- A hydraulically-operated main door,
- A mechanically-operated hinged door,
- A fairing door on the MLG leg.

All the doors close when the MLG retracts. When the MLG is extended the main door closes and the hinged door stays open. A manually operated mechanism (for maintenance personnel) lets the main doors be opened for access to the MLG bay when the aircraft is on the ground.

## 3. Centerline Landing Gear and Doors

The CLG has a four-wheel bogie beam assembly and a leg assembly that includes an oleo-pneumatic shock absorber. The CLG is supported longitudinally by a two-piece folding dragstay. The dragstay is locked mechanically by the lock links when the CLG is fully extended.

Each CLG bay has the following doors:

- Two hydraulically-operated center doors (each door includes a manually-operated maintenance door attached with hinges to the rear of the center door),
- A fairing door attached to the CLG leg, and an articulated door attached with a hinge to the fairing door.

#### 4. Nose Landing Gear and Doors

The NLG includes a twin-wheel axle assembly and an oleo-pneumatic shock-absorber. The NLG is supported longitudinally by a two-piece dragstay. The dragstay is locked mechanically by the lock links when the NLG is fully extended.

Each NLG bay has the following doors:

- Two hydraulically-operated FWD doors,
- Two mechanically-operated AFT doors,
- A fixed fairing door on the NLG leg.

All the doors close when the NLG retracts. When the NLG is extended the FWD doors close and the AFT doors stay open. A door opening mechanism lets the FWD doors be opened on the ground for access to the NLG bay.

#### 5. Nose Wheel Steering (NWS)

Nose wheel steering system is a computer controlled electro-hydraulic system. The system uses the green main hydraulic power system to operate the hydraulic components.

The steering is controlled by two hand wheel transmitters in the cockpit, which supply the primary steering inputs to the BSCU (Brake and Steering Control Unit).

A steering disconnection box is installed on the NLG to disconnect the steering for towing.

For the operation and control of nose wheel steering, refer to AMM 32-51-00.

For the steering angle limits, refer to AMM 09-10-00.

#### 6. Tow Truck Power

Electric power to the navigation lights can be provided through the tow truck power connector on the 5GC service panel, see FIGURE 2-9-0-991-017-A and for connector definition, see 05-04-04.

## 7. Landing Gear Servicing Points

### A. General

Fluid filling and gas charging of the MLG, CLG and NLG shock absorbers are accomplished through MS28889 standard valves.

### B. Charging Pressures

For charging of the landing gear shock absorbers, refer to AMM 12-14-32.

## 8. Landing Gear Control

The landing gear and door operation is controlled electrically by one of the two Landing Gear Control and Interface Units (LGCIU). Control changes from one LGCIU to the other after each extension cycle.

In normal operation, the landing gears and doors are operated by the green hydraulic system. In abnormal operation, the landing gears can be extended by the operation of electro-hydraulic free-fall-system. A switch in the cockpit disengage the doors and the landing gear uplocks. The landing gears then extend by free-fall, and lock down.

## 9. Braking

### A. General

Carbon multi-disc brakes are installed on each wheel of the MLG and the CLG. Each brake assembly has two wear indicators installed.

The braking system has four braking modes with autobrake and anti-skid systems:

- Normal braking with anti-skid,
- Alternate braking with anti-skid,
- Alternate braking without anti-skid,
- Parking brake with full brake pressure.

### B. In-Flight Wheel Braking

Braking occurs automatically during the retraction of the landing gears. This stops the rotation of the MLG and CLG wheels before the landing gears go into their related bays. The wheels of the NLG are braked by spring loaded pads.

## 10. Tire Pressure Indicating System (TPIS)

The TPIS automatically monitors the tire pressures and shows these values on Test Equipment (BITE) and also supplies other data and warnings on the WHEEL page of the System Display (SD).

## 11. Built In Test Equipment (BITE)

The BITE has hardware and software for these functions:

- to automatically do a self test at power-up,
- to continuously monitor the related systems for failures,
- to continuously monitor the interface with other specified systems in the aircraft,
- to keep a record of each failure and defect and send this data to other systems in the aircraft,
- to automatically do a functional test of some related systems before a landing,
- to do specified system tests during ground maintenance.

The BITE for the following systems is described in these chapters:

- The Brakes and Steering AMM 32-46-00,
- The TPIS AMM 32-49-00,
- The Landing GearAMM 32-69-00.

**2-12-0      Engine and Nacelle****\*\*ON A/C A340-500 A340-600**Engine and Nacelle**1.    Engine and Nacelle – TRENT 500 Engine****A.    Engine**

The RB211-TRENT 500 engine is a high bypass ratio, triple spool turbofan.

The principal modules of the engine are:

- The Low Pressure Compressor (LPC) rotor
- The Intermediate Pressure (IP) compressor
- The intermediate case
- The HP system (this includes the High Pressure Compressor (HPC), the combustion system and the High Pressure Turbine (HPT))
- The IP turbine
- The external gearbox.

The compressor system has three axial flow compressors in a triple spool configuration. The compressors are turned independently by their related turbines, each at its most satisfactory speed. The LP system has a single-stage compressor installed at the front of the engine. A shaft connects the compressor to a five-stage turbine at the rear of the gas generator. The gas generator also includes an eight-stage IP compressor, a six-stage HPC and a combustion system. Each of the compressors in the gas generator is connected to, and turned by, a different single-stage turbine. Between the HPC and the HPT is the annular combustion system which burns a mixture of fuel and air to supply energy as heat. Behind the LP turbine there is a collector nozzle assembly through which the hot gas exhaust flows. The external gearbox module is installed below the fan case. It has a gear train that decreases and increases the speed to meet the specified drive requirements of each accessory.

**B.    Nacelle**

A nacelle gives the engine an aerodynamic shape and supports the thrust reverser system. Each engine is housed in a nacelle suspended from a pylon attached below the wing. The nacelle consists of the following major components:

**(1) Air Intake Cowl Assembly**

The air intake cowl is an interchangeable aerodynamic cowl installed at the front of the engine. It ducts airflow to the fan and the engine core. The cowl has panels for easy access to the components. Acoustic materials are used in the manufacture of the cowl to help decrease the engine noise.

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

### (2) Fan Cowl Assembly

The fan cowl assembly has two semicircular panels, the left fan cowl and the right fan cowl, that enclose the engine fan case between the air intake cowl and the thrust reverser. There are four assemblies for each aircraft. Each fan cowl panel is interchangeable from one engine to a different engine, when the stakes are removed or installed.

### (3) Thrust Reverser

The thrust reverser is a component of the aircraft engine nacelle. The thrust reverser is a conventional fixed-cascade, translating-cowl type. The thrust reverser provides an aerodynamic flow path and uses the outer mobile structure, which is hydraulically powered, to provide a fan exhaust duct and a nozzle exit. In stow mode, the thrust reverser is an aerodynamic structure. In reverse mode, it is used to deflect and redirect part of the engine fan exhaust air by the blocker doors and in a forward direction through the cascades. The thrust reverser increases the aircraft wheel braking and the speed braking systems to reduce the landing distance.

### (4) Exhaust System

The turbine exhaust system consists of one exhaust nozzle and one exhaust plug. The exhaust nozzle is bolted to the engine low pressure turbine frame flange outer flange. It is acoustically treated. The exhaust plug is bolted to the engine low pressure turbine frame flange inner flange. It is a two-piece conical structure. The turbine exhaust flow path is formed by the inner wall of the exhaust nozzle and the outer wall of the exhaust plug.

**2-12-1 Auxiliary Power Unit****\*\*ON A/C A340-500 A340-600**Auxiliary Power Unit**1. General**

The Auxiliary Power Unit (APU) and its related mechanical components are installed at the rear part of the fuselage in the tailcone section. The APU compartment is a fireproof area (identified as the Fire Zone).

The APU is a pneumatic and shaft-power gas-turbine engine and is used for the ground and in-flight power supply of the aircraft.

The APU supplies:

- mechanical shaft-power to operate a generator
- bleed-air to the Main Engine Start (MES) and the Environmental Control System (ECS).

A part of the automatic system, with the pneumatic and the electromechanical controls, operates the start and the acceleration functions of the APU.

An air intake system with a flap-type door is installed in front of the APU compartment. The exhaust gases pass overboard at the end of the fuselage cone.

**2. Powerplant**

The APU is the Garrett Gas-Turbine Compressor Power-unit (GTCP) 331-600A with a single shaft engine.

The engine is the primary component of the APU, which is of the modular design. The modules of the engine are:

- The power section
- The load compressor
- The accessory drive gearbox with LRU(s).

The power section has a two-stage centrifugal compressor, a reverse-flow annular combustion chamber and a three-stage axial turbine. The power section directly operates the one-stage centrifugal load-compressor which supplies the bleed-air to the pneumatic system. The inlet guide vanes as part of the load compressor, control the airflow.

The power section also operates the gearbox which is attached to the load compressor. The following LRU's are mounted on the gearbox :

- the APU generator,
- the starter motor,
- the oil pump,

- the Fuel Control Unit (FCU),

The APU has a gearbox-driven oil-cooled AC generator.

The cooling air and ventilation system of the APU supplies the air for cooling of the APU and the equipment on the APU. It also supplies the air for ventilation of the APU compartment.

### 3. Control circuit

The Electronic Control Box (ECB), which controls the Fuel Control Unit (FCU) and the Inlet Guide Vanes (IGV), keeps the APU at a constant speed. The control circuit is used to start the APU, to shut it down, to control it and to prevent internal failure.

### 4. Controls and Indication

The primary APU controls and indications are installed in the overhead panel, on the center pedestal panel and on the forward center panel. External APU panels are also installed on the nose landing gear and on the refuel/defuel panel, to initiate an APU emergency shut-down.

**2-13-0      Levelling, symmetry and Alignment****\*\*ON A/C A340-500 A340-600**Leveling, Symmetry and Alignment**1. Quick Leveling**

There are three alternative procedures to level the aircraft:

- Quick leveling procedure with Air Data/Inertial Reference System (ADIRS)
- Quick leveling procedure with a spirit level in the passenger compartment
- Quick leveling procedure with a spirit level in the FWD cargo compartment.

**2. Precision Leveling**

For precise leveling, it is necessary to install sighting rods in the receptacles located under the fuselage (points 12 and 13 for longitudinal leveling) and under the wings (points 2LH and 2RH for lateral leveling) and use a sighting tube. With the aircraft on jacks, adjust the jacks until the reference marks on the sighting rods are aligned in the sighting plane (aircraft level).

**3. Symmetry and Alignment Check**

Possible deformation of the aircraft is measured by photogrammetry.

**2-14-0      Jacking for Maintenance****\*\*ON A/C A340-500 A340-600**Jacking for Maintenance**1. Aircraft Jacking Points for Maintenance****A. General**

- (1) The A340-500/-600 can be jacked:
- At not more than 200 000 kg (440 924 lb),
  - Within the limits of the permissible wind speed when the aircraft is jacked outside a closed environment.

**B. Primary Jacking Points**

- (1) The aircraft is provided with three primary jacking points:
- One located under the forward fuselage (after FR10),
  - Two located under the wings (one under each wing), at the intersection of RIB10 and the rear of the spar-datum.
- (2) Three jack adapters (ground equipment) are used as intermediary parts between the aircraft jacking points and the jacks:
- One male spherical jack adapter at the forward fuselage,
  - Two female spherical jack pad adapters at the wings (one at each wing).

**C. Auxiliary Jacking Point (Safety Stay)**

- (1) When the aircraft is on jacks, a safety stay is placed under the fuselage at FR87 to prevent tail tipping caused by accidental displacement of the aircraft center of gravity.
- (2) The safety point must not be used for lifting the aircraft.
- (3) One male spherical stay adapter (ground equipment) is used as an intermediary part between the aircraft safety point and the stay.

**2. Jacks and Safety Stay****A. Jack Design**

- (1) The maximum eligible loads given in the table (Ref. FIGURE 2-14-0-991-015-AFIGURE 2-14-0-991-015-B) are the maximum loads applicable on jack fittings.
- (2) In fully retracted position (jack stroke at minimum), the height of the jack is such that the jack may be placed beneath the aircraft under the most adverse conditions, namely, tires deflated and shock absorbers depressurized, with sufficient clearance between the aircraft jacking point and the jack upper end.

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

- (3) The lifting jack stroke enables the aircraft to be jacked up so that the Fuselage Datum Line (FDL) may be positioned up to 7.2 m (23.62 ft) from the ground to allow all required maintenance procedures and in particular, the removal/installation of the landing-gear shock absorbers.

### B. Safety Stay

The stay stroke enables the aircraft tail to be supported up to the Fuselage Datum Line (FDL) positioned 7.2 m (23.62 ft) from the ground.

**2-14-1 Jacking of the Landing Gear****\*\*ON A/C A340-500 A340-600**Jacking of the Landing Gear**1. General**

Landing gear jacking will be required to lift the landing gear wheels off the ground.

NOTE : You can lift the aircraft at Maximum Ramp Weight (MRW).

NOTE : The load at each jacking position is the load required to give 25.4 mm (1 in) clearance between the ground and the tire.

**2. Main Gear Jacking**

The main gears are normally jacked up by placing a jack directly under the ball pad.

The ball spherical radius is 19 mm (0.75 in).

It is also possible to jack the main gear using a cantilever jack.

**3. Nose Gear Jacking**

For nose gear jacking, a 19 mm (0.75 in) radius ball pad is fitted under the lower end of the shock-absorber sliding tube. Jacking can be accomplished either by placing a jack directly under the ball pad, or using an adapter fitting provided with an identical ball pad.

**4. Center Gear Jacking**

For center gear jacking, a 19 mm (0.75 in) radius ball pad is fitted under the lower end of the shock-absorber sliding tube. Jacking can be accomplished either by placing a jack directly under the ball pad, or using an adapter fitting provided with an identical ball pad.

**2-14-2      Support of Aircraft****\*\*ON A/C A340-500 A340-600**Support of Aircraft**1.    Support of Aircraft**

When it is necessary to support the aircraft in order to relieve the loads on the structure for the accomplishment of modifications or major work, it is advisable to provide adapters under the wings and the fuselage for an alternative means of lifting.

The aircraft must not be lifted or supported by the wings or fuselage alone. It is important to support the aircraft fuselage and wings at the same time to prevent structural damage.

**A.    Shoring Cradles**

Shoring cradles are used when it is necessary to stress-jack the aircraft to carry out maintenance and repair work. These are used to oppose the deflections of the wings and reduce the stresses to an acceptable level at the area of maintenance and repair.

The shoring cradles, each with two adjustable pads, 152.4 mm (6 in) square, are positioned at four locations under each wing.

The adjustable pads are faced with thin rubber and are in contact with the wing profile at the datum intersections of the ribs and the front and rear spars (F/S and R/S).

**3-5-0      Final Approach Speed****\*\*ON A/C A340-500 A340-600**Final Approach Speed**\*\*ON A/C A340-500**

## 1. Final Approach Speed

- A. This section gives the final approach speed. This is the indicated airspeed at threshold in the landing configuration, at the certificated maximum flap setting and maximum landing weight, in standard atmospheric conditions. The approach speed is used to classify the aircraft into an Aircraft Approach Category, a grouping of aircraft based on the indicated airspeed at threshold.
- B. The final approach speed is 146 kt at a Maximum Landing Weight (MLW) of 246 000 kg (542 337 lb) and classifies the aircraft into the Aircraft Approach Category D.

NOTE : This value is given for information only.

**\*\*ON A/C A340-600**

## 2. Final Approach Speed

- A. This section gives the final approach speed. This is the indicated airspeed at threshold in the landing configuration, at the certificated maximum flap setting and maximum landing weight, in standard atmospheric conditions. The approach speed is used to classify the aircraft into an Aircraft Approach Category, a grouping of aircraft based on the indicated airspeed at threshold.
- B. The final approach speed is 153 kt at a Maximum Landing Weight (MLW) of 265 000 kg (584 225 lb) and classifies the aircraft into the Aircraft Approach Category D.

NOTE : This value is given for information only.

## **GROUND MANEUVERING**

### **4-1-0 General Information**

#### **\*\*ON A/C A340-500 A340-600**

##### **General Information**

1. This section gives aircraft turning capability and maneuvering characteristics.

For ease of presentation, this data has been determined from the theoretical limits imposed by the geometry of the aircraft, and where noted, gives for a normal allowance for tire slippage. As such, it reflects the turning capability of the aircraft in favorable operating circumstances. This data should only be used as guidelines for the method of determination of such parameters and for the maneuvering characteristics of this aircraft type.

In the ground operating mode, varying airline practices may demand that more conservative turning procedures be adopted to avoid excessive tire wear and reduce possible maintenance problems. Airline operating techniques will vary in the level of performance, over a wide range of operating circumstances throughout the world. Variations from standard aircraft operating patterns may be necessary to satisfy physical constraints within the maneuvering area, such as adverse grades, limited area or high risk of jet blast damage. For these reasons, ground maneuvering requirements should be coordinated with the airlines in question prior to layout planning

**NOTE :** The following chapter takes into account ICAO Annex 14 to the Convention on International Civil Aviation, Aerodromes - Volume I, Aerodrome Design and Operations, Eighth Edition, July 2018.

**4-5-0 Runway and Taxiway Turn Paths****\*\*ON A/C A340-500 A340-600**Runway and Taxiway Turn Paths

1. This section gives the runway and taxiway turn paths for the following configurations:

- 135° Turn - Runway to Taxiway
- 90° Turn - Runway to Taxiway
- 180° Turn on a Runway
- 135° Turn - Taxiway to Taxiway
- 90° Turn - Taxiway to Taxiway.

The turn paths Runway to Taxiway and Taxiway to Taxiway are defined using 3 methods:

- Oversteering method,
- External and Taxiing Aid Camera System (ETACS) assisted steering method,
- Cockpit over centerline method.

The 180° Turn on runway is defined using the following method:

- 180° Turn using edge of runway method.

NOTE : The fillet design and the turn radii are as per FAA AC 150/5300-13 Change 18.

**4-7-0      Minimum Line-Up Distance Corrections****\*\*ON A/C A340-500 A340-600**Minimum Line-Up Distance Corrections

1. The ground maneuvers were performed using asymmetric thrust and differential-only braking to initiate the turn.

Maneuvers of this section are calculated with turn characteristics as given in chapter 04-02-00.

TODA: Take-Off Distance Available

ASDA: Acceleration-Stop Distance Available

2. 90° Turn on Runway Entry

This section gives the minimum line-up distance correction for a 90° turn on runway entry.

This maneuver consists in a 90° turn at minimum turn radius. It starts with the edge of the MLG at a distance of 4.0 m (13 ft) from the taxiway edge, and finishes with the aircraft aligned on the centerline of the runway, see FIGURE 4-7-0-991-025-A.

During the turn, all the clearances must meet the minimum value of 4.0 m (13 ft) for this category of aircraft as recommended in ICAO Annex 14 (Eighth Edition).

3. 180° Turn on Runway Turn Pad

This section gives the minimum line-up distance correction for a 180° turn on the runway turn pad.

This maneuver consists in a 180° turn at minimum turn radius on a runway turn pad with standard ICAO geometry.

It starts with the edge of the MLG at a distance of 4.0 m (13 ft) from the pavement edge, and it finishes with the aircraft aligned on the centerline of the runway, see FIGURE 4-7-0-991-026-A. During the turn, all the clearances must meet the minimum value of 4.0 m (13 ft) for this category of aircraft as recommended in ICAO Annex 14 (Eighth Edition).

4. 180° Turn on Runway Width

This section gives the minimum line-up distance correction for a 180° turn on the runway width. For this maneuver, the pavement width is considered to be the runway width, which is a frozen parameter (45 m (150 ft) and 60 m (200 ft)).

As per the standard operating procedures for the "180° turn on runway" (described in the Flight Crew Operating Manual (FCOM)), the aircraft is initially angled with respect to the runway centerline when starting the 180° turn, see FIGURE 4-7-0-991-027-A.

The value of this angle depends on the aircraft type and is mentioned in the FCOM.

During the turn, all the clearances must meet the minimum value of 4.0 m (13 ft) for this category of aircraft as recommended in ICAO Annex 14 (Eighth Edition).

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

NOTE : The minimum line-up distances may need a lower steering angle than maximum steering angle.

**5-2-0 Terminal Operations - Full Servicing****\*\*ON A/C A340-600**Terminal Operations - Full Servicing Turn Round Time

1. This section provides a typical turn round time charts showing the typical time for ramp activities during aircraft turn round.

Actual times may vary due to each operator's specific practices, resources, equipment and operating conditions.

2. Assumptions used for full servicing turn round time chart

**A. PASSENGER HANDLING**

319 pax: 12 F/C + 42 B/C + 265 Y/C.

All passengers deplane and board the aircraft.

2 Passenger Boarding Bridges (PBB) used at doors L1 and L2.

Equipment positioning + opening door = +3 min.

Closing door + equipment removal = +3 min.

No Passenger with Reduced Mobility (PRM) on board.

Deplaning:

- 160 pax at door L1 (12 F/C + 42 B/C + 106 Y/C)

- 159 pax at door L2 (159 Y/C)

- Deplaning rate = 25 pax/min per door

- Priority deplaning for premium passengers.

Boarding:

- 160 pax at door L1 (12 F/C + 42 B/C + 106 Y/C)

- 159 pax at door L2 (159 Y/C)

- Boarding rate = 15 pax/min per door

- Last Pax Seating allowance (LPS) + headcounting = +4 min.

**B. CARGO**

2 cargo loaders + 1 belt loader.

Opening door + equipment positioning = +2.5 min.

Equipment removal + closing door = +2.5 min.

Cargo exchange:

- FWD cargo compartment: 20 LD3

- AFT cargo compartment: 6 pallets

- Bulk cargo compartment: 1 000 kg (2 205 lb).

LD3 unloading/loading times:

- Unloading = 1.2 min/LD3
- Loading = 1.4 min/LD3.

Pallet unloading/loading times:

- Unloading = 2.4 min/pallet
- Loading = 2.8 min/pallet.

Bulk unloading/loading times:

- Unloading = 9.2 min/t
- Loading = 10.5 min/t.

### C. REFUELING

Block-fuel quantity for nominal range through 4 nozzles.

178 000 l (47 023 US gal) at 50 psi (3.45 bar).

Dispenser positioning + connection = +3 min.

Disconnection + dispenser removal = +3 min.

### D. CLEANING

Cleaning is performed in available time.

### E. CATERING

3 catering trucks for servicing galleys at doors R1, R2 and R5.

Equipment positioning + opening door = +5 min.

Closing door + equipment removal = +3 min.

Full Size Trolley Equivalent (FSTE) to unload and load: 45 FSTE

- 9 FSTE at door R1
- 9 FSTE at door R2
- 27 FSTE at door R5.

Time for trolley exchange = 1.5 min per FSTE.

### F. GROUND HANDLING/GENERAL SERVICING

Start of operations:

- Bridges:  $t_0 = 0$
- Others:  $t_0 + 1$  min.

Vehicle positioning/removal = +2 min (except for fuel and catering trucks).

Ground Power Unit (GPU): up to  $2 \times 90$  kVA.

Air conditioning: two hoses.

Potable water servicing: 100% uplift, 700 l (185 US gal) at 60 l/min (15.85 US gal/min).

Waste water servicing: draining + rinsing.

#### Terminal Operations - Full Servicing Turn Round Time

1. This section provides a typical turn round time charts showing the typical time for ramp activities during aircraft turn round.

Actual times may vary due to each operator's specific practices, resources, equipment and operating conditions.

2. Assumptions used for full servicing turn round time chart

##### A. PASSENGER HANDLING

246 pax: 8 F/C + 42 B/C + 196 Y/C.

All passengers deplane and board the aircraft.

2 Passenger Boarding Bridges (PBB) used at doors L1 and L2.

Equipment positioning + opening door = +3 min.

Closing door + equipment removal = +3 min.

No Passenger with Reduced Mobility (PRM) on board.

Deplaning:

- 123 pax at door L1 (8 F/C + 42 B/C + 73 Y/C)
- 123 pax at door L2 (123 Y/C)
- Deplaning rate = 25 pax/min per door
- Priority deplaning for premium passengers.

Boarding:

- 123 pax at door L1 (8 F/C + 42 B/C + 73 Y/C)
- 123 pax at door L2 (123 Y/C)
- Boarding rate = 15 pax/min per door
- Last Pax Seating allowance (LPS) + headcounting = +4 min.

##### B. CARGO

2 cargo loaders + 1 belt loader.

Opening door + equipment positioning = +2.5 min.

Equipment removal + closing door = +2.5 min.

Cargo exchange:

- FWD cargo compartment: 16 LD3
- AFT cargo compartment: 4 pallets
- Bulk cargo compartment: 1 000 kg (2 205 lb).

LD3 unloading/loading times:

- Unloading = 1.2 min/LD3

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

- Loading = 1.4 min/LD3.

Pallet unloading/loading times:

- Unloading = 2.4 min/pallet
- Loading = 2.8 min/pallet.

Bulk unloading/loading times:

- Unloading = 9.2 min/t
- Loading = 10.5 min/t.

### C. REFUELING

Block-fuel quantity for nominal range through 4 nozzles.

191 000 l (50 457 US gal) at 50 psi (3.45 bar).

Dispenser positioning + connection = +3 min.

Disconnection + dispenser removal = +3 min.

### D. CLEANING

Cleaning is performed in available time.

### E. CATERING

3 catering trucks for servicing galleys at doors R1, R2 and R4.

Equipment positioning + opening door = +5 min.

Closing door + equipment removal = +3 min.

Full Size Trolley Equivalent (FSTE) to unload and load: 39 FSTE

- 8 FSTE at door R1
- 9 FSTE at door R2
- 22 FSTE at door R4.

Time for trolley exchange = 1.5 min per FSTE.

### F. GROUND HANDLING/GENERAL SERVICING

Start of operations:

- Bridges:  $t_0 = 0$
- Others:  $t_0 + 1$  min.

Vehicle positioning/removal = +2 min (except for fuel and catering trucks).

Ground Power Unit (GPU): up to  $2 \times 90$  kVA.

Air conditioning: two hoses.

Potable water servicing: 100% uplift, 700 l (185 US gal) at 60 l/min (15.85 US gal/min).

Waste water servicing: draining + rinsing.

### 5-4-2 Grounding Points

#### **\*\*ON A/C A340-500 A340-600**

##### Grounding (Earthing) Points

#### **\*\*ON A/C A340-600**

##### 1. Grounding (Earthing) Points

ACCESS	AFT OF NOSE	DISTANCE		
		FROM AIRCRAFT CENTERLINE		MEAN HEIGHT FROM GROUND
		LH SIDE	RH SIDE	
On Nose Landing Gear leg:	6.57 m (21.56 ft)	On centerline		1.40 m (4.59 ft)
On left Main Landing Gear leg:	39.45 m (129.43 ft)	5.34 m (17.52 ft)		1.50 m (4.92 ft)
On right Main Landing Gear leg:	39.45 m (129.43 ft)		5.34 m (17.52 ft)	1.50 m (4.92 ft)

- A. The grounding (earthing) stud on each landing gear leg is designed for use with a clip-on connector (such as Appleton TGR).
- B. The grounding (earthing) studs are used to connect the aircraft to an approved ground (earth) connection on the ramp or in the hangar for:
  - Refuel/defuel operations
  - Maintenance operations
  - Bad weather conditions.

NOTE : In all other conditions, the electrostatic discharge through the tire is sufficient.

## 1. Refuel/Defuel Control Panel

ACCESS	DISTANCE			MEAN HEIGHT FROM GROUND	
	AFT OF NOSE	FROM AIRCRAFT CENTERLINE			
		LH SIDE	RH SIDE		
Refuel/Defuel Control Panel: Access Door 198FB	42.5 m (139.44 ft)	-	1.4 m (4.59 ft)	2 m (6.56 ft)	

- A. Refuel/Defuel pressure/suction:
  - Maximum pressure: 50 psi (3.45 bar)
  - Maximum suction: 11 psi (0.76 bar).
- B. Flow rate:
  - 2 couplings (total/min): 1576 l (416 US gal)
  - 4 couplings (total/min): 1438 l (380 US gal).

## 2. Refuel/Defuel Connectors

ACCESS	DISTANCE			MEAN HEIGHT FROM GROUND	
	AFT OF NOSE	FROM AIRCRAFT CENTERLINE			
		LH SIDE	RH SIDE		
Refuel/Defuel Coupling, Left: Access Door 522HB	37.1 m (121.72 ft)	-	12.6 m (41.34 ft)	5 m (16.4 ft)	
Refuel/Defuel Coupling, Right: Access Door 622HB	37.1 m (121.72 ft)	12.6 m (41.34 ft)	-	5 m (16.4 ft)	

- A. Refuel/Defuel couplings:
  - Four standard 2.5 in. ISO 45 connections.

# A340-500/-600

### 5-4-8 Oil System

#### **\*\*ON A/C A340-500 A340-600**

##### Oil Servicing

#### **\*\*ON A/C A340-600**

##### 1. RR TRENT 500 Series Engine

###### A. Engine Oil Replenishment:

One gravity filling cap and one pressure filling connection per engine.

ACCESS	DISTANCE			
	AFT OF NOSE	FROM AIRCRAFT CENTERLINE		MEAN HEIGHT FROM GROUND
		LH SIDE	RH SIDE	
Engine 1: Access Door: 416BR	36.30 m (119.09 ft)	17.85 m (58.56 ft)		3.15 m (10.33 ft)
Engine 2: Access Door: 426BR	29.70 m (97.44 ft)	7.95 m (26.08 ft)		1.60 m (5.25 ft)
Engine 3: Access Door: 436BR	29.70 m (97.44 ft)		10.80 m (35.43 ft)	1.60 m (5.25 ft)
Engine 4: Access Door: 446BR	36.30 m (119.09 ft)		20.70 m (67.91 ft)	3.15 m (10.33 ft)

###### (1) Approximate tank capacity:

- Full level: 23.70 l (6.26 US gal).
- Usable: 15.90 l (4.20 US gal).

###### B. IDG Oil Replenishment:

One pressure filling connection per engine.

ACCESS	DISTANCE			
	AFT OF NOSE	FROM AIRCRAFT CENTERLINE		MEAN HEIGHT FROM GROUND
		LH SIDE	RH SIDE	
Engine 1: Access Door: 415CL	36.97 m (121.29 ft)	19.66 m (64.50 ft)		1.85 m (6.07 ft)

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

ACCESS	DISTANCE			
	AFT OF NOSE	FROM AIRCRAFT CENTERLINE		MEAN HEIGHT FROM GROUND
		LH SIDE	RH SIDE	
Engine 2: Access Door: 425CL	30.36 m (99.61 ft)	9.76 m (32.02 ft)		0.80 m (2.62 ft)
Engine 3: Access Door: 435CL	30.36 m (99.61 ft)		8.98 m (29.46 ft)	0.80 m (2.62 ft)
Engine 4: Access Door: 445CL	36.97 m (121.29 ft)		18.87 m (61.91 ft)	1.85 m (6.07 ft)

- (1) IDG oil replenishment:
  - one ozone self-sealing pressure fill and overfill connector.
- (2) Max delivery pressure:
  - 2.41 bar (34.95 psi).
- (3) Approximate max oil capacity of the IDG:
  - 6.80 l (1.80 US gal).

C. Starter Oil Replenishment:  
One filling connection per engine.

ACCESS	DISTANCE			
	AFT OF NOSE	FROM AIRCRAFT CENTERLINE		MEAN HEIGHT FROM GROUND
		LH SIDE	RH SIDE	
Engine 1: Access Door: 415AL (416AR)	36.30 m (119.09 ft)	19.72 m (64.70 ft)		1.80 m (5.91 ft)
Engine 2: Access Door: 425AL (426AR)	29.70 m (97.44 ft)	9.82 m (32.22 ft)		0.77 m (2.53 ft)
Engine 3: Access Door: 435AL (436AR)	29.70 m (97.44 ft)		8.92 m (29.27 ft)	0.77 m (2.53 ft)
Engine 4: Access Door: 445AL (446AR)	36.30 m (119.09 ft)		18.82 m (61.75 ft)	1.80 m (5.91 ft)

- (1) Pneumatic starter, oil replenishment:
  - one gravity filling plug.

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

### \*\*ON A/C A340-500 A340-600

EXAMPLE TO DETERMINE THE AIRFLOW REQUIRED AT THE FUSELAGE CONNECTION:

-FOR AN AIR START UNIT DELIVERING 60 PSIA (4.14 BARS) AIR PRESSURE AT THE FUSELAGE CONNECTOR

-AT A SUPPLIED AIR TEMPERATURE OF 220°C (428°F) AT THE FUSELAGE CONNECTOR

1. DRAW AN HORIZONTAL LINE FROM THE SUPPLIED AIR PRESSURE (60 PSIA (4.14 BARS)).

2. FROM THE INTERSECTION WITH THE AIR SUPPLY TEMPERATURE AT FUSELAGE CONNECTION (220°C (428°F)), DRAW A VERTICAL LINE.

3. THE INTERSECTION WITH THE HORIZONTAL AXIS GIVES THE REQUIRED AIRFLOW AT GROUND CONNECTION (125 kg/min (2.08 kg/s)).

**5-6-0      Ground Pneumatic Power Requirements****\*\*ON A/C A340-500 A340-600**Ground Pneumatic Power Requirements**1. General**

This section describes the required performance for the ground equipment to maintain the cabin temperature at 27 °C (80.6 °F) for the cooling or 21 °C (69.8 °F) for heating cases after boarding (Section 5.7 - steady state), and provides the time needed to cool down or heat up the aircraft cabin to the required temperature (Section 5.6 - dynamic cases with aircraft empty).

ABBREVIATION	DEFINITION
A/C	Aircraft
AHM	Aircraft Handling Manual
GC	Ground Connection
GSE	Ground Service Equipment
IFE	In-Flight Entertainment
LP	Low Pressure
LPGC	Low Pressure Ground Connection
OAT	Outside Air Temperature
PCA	Pre-Conditioned Air

- A. The air flow rates and temperature requirements for the GSE, provided in Sections 5.6 and 5.7, are given at A/C ground connection.

NOTE : The cooling capacity of the equipment (kW) is only indicative and is not sufficient by itself to ensure the performance (outlet temperature and flow rate combinations are the requirements needed for ground power).

An example of cooling capacity calculation is given in Section 5.7.

- B. The air flow rates and temperature requirements for the GSE are given for the A/C in the configuration "2 LP ducts connected".

NOTE : The maximum air flow is driven by pressure limitation at LPGC.

- C. For temperatures at ground connection below +2 °C (+35.6 °F) (Subfreezing), the ground equipment shall be compliant with the Airbus document "Subfreezing PCA Carts – Compliance Document for Suppliers" (contact Airbus to obtain this document) defining all the requirements with which Subfreezing Pre-Conditioning Air equipment must comply to allow its use on Airbus aircraft. These requirements are in addition to the functional specifications included in the IATA AHM997.
- 2. Ground Pneumatic Power Requirements

This section provides the ground pneumatic power requirements for:

- Heating (pull up) the cabin, initially at OAT, up to 21 °C (69.8 °F) (see FIGURE 5-6-0-991-005-A)
- Cooling (pull down) the cabin, initially at OAT, down to 27 °C (80.6 °F) (see FIGURE 5-6-0-991-006-A).

**5-7-0      Preconditioned Airflow Requirements****\*\*ON A/C A340-500 A340-600**Preconditioned Airflow Requirements

1. This section provides the preconditioned airflow rate and temperature needed to maintain the cabin temperature at 24 °C (75.2 °F) for the cooling or 21 °C (69.8 °F) for the heating cases.

These settings are not intended to be used for operation (they are not a substitute for the settings given in the AMM). They are based on theoretical simulations and give the picture of a real steady state.

The purpose of the air conditioning (cooling) operation (described in the AMM) is to maintain the cabin temperature below 27 °C (80.6 °F) during boarding (therefore it is not a steady state).

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

**\*\*ON A/C A340-500 A340-600**

— OAT ISA; EMPTY CABIN; IFE ON; LIGHTS ON; NO SOLAR LOAD; RECIRCULATION FANS ON; GALLEYS ON  
— OAT ISA -38° C (-36.4° F); EMPTY CABIN; IFE OFF; LIGHTS ON; NO SOLAR LOAD; RECIRCULATION FANS ON; GALLEYS OFF

**EXAMPLE:**

COOLING CAPACITY CALCULATION:

FOR THE CONDITIONS "C", THE COOLING CAPACITY OF  $1.6 \text{ kg/s} \times 1 \text{ kJ/(kg.}^\circ\text{C)} \times (24 - 10) = 22.4 \text{ kW}$  (OR 6.7 TONS COOLING CAPACITY) IS NEEDED TO MAINTAIN THE CABIN TEMPERATURE AT 24° C (75.2° F) (1.6 kg/s AT 10° C (50° F) FOR AIR AT GC INLET).

Preconditioned Airflow Requirements  
FIGURE-5-7-0-991-004-A01

**5-8-0      Ground Towing Requirements****\*\*ON A/C A340-500 A340-600**Ground Towing Requirements

1. This section provides information on aircraft towing.

The A340-500/-600 is designed with means for conventional or towbarless towing. Information/procedures can be found for both in chapter 9 of the Aircraft Maintenance Manual.

Status on towbarless towing equipment qualification can be found in ISI 09.11.00001.

It is possible to tow or push the aircraft, at maximum ramp weight with engines at zero or up to idle thrust, using a towbar attached to the NLG. One towbar fitting is installed at the front of the leg (optional towing fitting for towing from the rear of the NLG available).

The main landing gears have attachment points for towing or debogging (for details, refer ARM 07).

This section shows the chart to determine the drawbar pull and tow tractor mass requirements as a function of the following physical characteristics:

- Aircraft weight,
- Number of engines at idle,
- Slope.

The following chart is applicable to both A340-500 and -600 aircraft.

**2. Towbar design guidelines**

The aircraft towbar shall comply with the following standards:

- ISO 8267-1, "Aircraft - Towbar Attachment Fitting - Interface Requirements - Part 1: Main Line Aircraft",
- ISO 9667, "Aircraft Ground Support Equipment - Towbars",
- IATA Airport Handling Manual AHM 958, "Functional Specification for an Aircraft Towbar".

A conventional type towbar is required which should be equipped with a damping system (to protect the NLG against jerks) and with towing shear pins:

- A traction shear pin calibrated at 40 400 daN (90 823 lbf),
- A torsion pin calibrated at 4 800 m.daN (424 836 lbf.in).

The towing head is designed according to ISO 8267-1, cat. IV.

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

**\*\*ON A/C A340-500 A340-600**

EXAMPLE HOW TO DETERMINE THE TRACTION WHEEL LOAD REQUIREMENT TO TOW A A340-500 OR -600 AT 380 000 kg, AT 1.5% SLOPE, 2 ENGINES AT IDLE AND FOR WET TARMAC CONDITIONS:

- ON THE RIGHT HAND SIDE OF THE GRAPH, CHOOSE THE RELEVANT AIRCRAFT WEIGHT (380 000 kg),
  - FROM THIS POINT DRAW A PARALLEL LINE TO THE REQUIRED SLOPE PERCENTAGE (1.5%),
  - FROM THE POINT OBTAINED DRAW A STRAIGHT HORIZONTAL LINE UNTIL No. OF ENGINES AT IDLE = 4,
  - FROM THIS POINT DRAW A PARALLEL LINE TO THE REQUESTED No. OF ENGINES (2),
  - FROM THIS POINT DRAW A STRAIGHT HORIZONTAL LINE TO THE DRAWBAR PULL AXIS,
  - THE Y-COORDINATE OBTAINED IS THE NECESSARY DRAWBAR PULL FOR THE TRACTOR (30 300 kg),
  - SEARCH THE INTERSECTION WITH THE "WET CONCRETE" LINE.
- THE OBTAINED X-COORDINATE IS THE RECOMMENDED MINIMUM TRACTOR WEIGHT (53 100 kg).

### NOTE:

FOR ALL WHEEL-DRIVEN VEHICLES, THE TOTAL TRACTION WHEEL LOAD IS THE TRACTOR WEIGHT.

**PAVEMENT DATA****7-1-0 General Information****\*\*ON A/C A340-500 A340-600****General Information**

1. A brief description of the pavement charts that follow will help in the airport planning.

To aid in the interpolation between the discrete values shown, each aircraft configuration is shown with a minimum range of five loads on the Main Landing Gear (MLG).

All curves on the charts represent data at a constant specified tire pressure with:

- The aircraft loaded to the Maximum Ramp Weight (MRW)
- The Center of Gravity (CG) at its maximum permitted aft position.

Pavement requirements for commercial aircraft are derived from the static analysis of loads imposed on the MLG struts.

Landing Gear Footprint:

Section 07-02-00 gives basic data on the landing-gear footprint configuration, MRW, tire dimensions and pressures.

Maximum Pavement Loads:

Section 07-03-00 shows maximum vertical and horizontal pavement loads for specific critical conditions at the tire-ground interfaces.

Landing Gear Loading on Pavement:

The curves related to the landing gear loading on pavement are not given in section 07-04-00. Because the relationship between the aircraft weight, the CG and the landing gear loading on the pavement is not strictly linear, it cannot be shown in chart format.

But you can find in section 07-03-00 the maximum vertical and horizontal pavement loads for some critical conditions at the tire/ground interfaces for all the operational weight variants of the aircraft.

For questions that are related to landing gear loading on pavement, contact Airbus.

Flexible Pavement Requirements - US Army Corps of Engineers Design Method:

The flexible pavement-requirements curves as per as U.S. Army Corps of Engineers Design Method are not given in section 07-05-00 since the related data is available through free software.

Sections 07-02-00 and 07-03-00 give all the inputs data required for the use of such software.

For questions that are related to the flexible pavement requirements, contact Airbus.

Flexible Pavement Requirements - LCN Conversion Method:

# A340-500/600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

The Load Classification Number (LCN) curves are not given in section 07-06-00 since the LCN system for the reporting pavement strength is old and are replaced by the ICAO recommended ACN/PCN system in 1983 and ACR/PCR system in 2020.

For questions that are related to the LCN system, contact Airbus.

Rigid Pavement Requirements - PCA (Portland Cement Association) Design Method:

The rigid-pavement requirement curves as per as Portland Cement Association Design Method are not given in section 07-07-00 since the related data is available through free software.

Sections 07-02-00 and 07-03-00 give all the inputs data required for the use of such software.

For questions that are related to the rigid pavement requirements, contact Airbus.

Rigid Pavement Requirements - LCN Conversion:

The Load Classification Number (LCN) curves are not given in section 07-08-00 since the LCN system for the reporting pavement strength is old and are replaced by the ICAO recommended ACN/PCN system in 1983 and ACR/PCR system in 2020.

For questions that are related to the LCN system, contact Airbus.

ACN/PCN Reporting System:

Section 07-09-00 gives ACN data prepared according to the ACN/PCN system as referenced in ICAO Annex 14, "Aerodromes", Volume 1 "Aerodrome Design and Operations".

Eighth Edition July 2018, incorporating Amendments 1 to 14 and ICAO doc 9157, "Aerodrome Design Manual", part 3 "Pavements" Second Edition 1983.

The ACN/PCN system is applicable until November 2024.

ACN is the Aircraft Classification Number and PCN is the related Pavement Classification Number.

An aircraft with an ACN less than or equal to the PCN can operate without restriction on the pavement.

Numerically the ACN is two times the derived single-wheel load expressed in thousands of kilograms.

The derived single-wheel load is calculated as the load on a single tire inflated to 1.25 MPa (181 psi) that can have the same pavement requirements as the aircraft.

Computationally the ACN/PCN system uses the PCA program PDILB for rigid pavements and S-77-1 for flexible pavements to calculate ACN values.

The airport authority must select the method of pavement analysis.

The results of their analysis must be reported with the following format:

PCN			
PAVEMENT TYPE	SUBGRADE CATEGORY	TIRE PRESSURE CATEGORY	EVALUATION METHOD
R - Rigid	A - High	W - No Limit	T - Technical
F - Flexible	B - Medium	X - To 1.75 MPa (254 psi)	U - Using Aircraft
	C - Low	Y - To 1.25 MPa (181 psi)	
	D - Ultra Low	Z - To 0.5 MPa (73 psi)	

Section 07-09-00 shows the aircraft ACN values.

For flexible pavements, the four subgrade categories are:

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

A. High Strength	CBR 15
B. Medium Strength	CBR 10
C. Low Strength	CBR 6
D. Ultra Low Strength	CBR 3

For rigid pavements, the four subgrade categories are:

A. High Strength	Subgrade k = 150 MN/m <sup>3</sup> (550 pci)
B. Medium Strength	Subgrade k = 80 MN/m <sup>3</sup> (300 pci)
C. Low Strength	Subgrade k = 40 MN/m <sup>3</sup> (150 pci)
D. Ultra Low Strength	Subgrade k = 20 MN/m <sup>3</sup> (75 pci)

### ACR/PCR Reporting System:

Section 07-10-00 gives ACR data prepared according to the ACR/PCR system as referenced in ICAO Annex 14, "Aerodromes", Volume 1 "Aerodrome Design and Operations".

Eight Edition July 2018, incorporating Amendments 1 to 15 and ICAO doc 9157, "Aerodrome Design Manual", part 3 "Pavements" Third Edition 2021.

The ACR/PCR system is effective from November 2020 and will be applicable until November 2024.

ACR is the Aircraft Classification Rating and PCR is the related Pavement Classification Rating. An aircraft with an ACR less than or equal to the PCR can operate without restriction on the pavement.

Numerically the ACR is two times the derived single-wheel load expressed in hundreds of kilograms.

The derived single-wheel load is calculated as the load on a single tire inflated to 1.50 MPa (218 psi) that can have the same pavement requirements as the aircraft.

Computationally the ACR/PCR system relies on the Linear Elastic Analysis (LEA). The ACR are computed with the official ICAO-ACR software.

States can start their own methods for PCR determination, which agree with the overall parameters of the ACR/PCR method.

The results of their analysis should be reported with the following format:

PCR			
PAVEMENT TYPE	SUBGRADE CATEGORY	TIRE PRESSURE CATEGORY	EVALUATION METHOD
R - Rigid	A - High	W - No Limit	T - Technical
F - Flexible	B - Medium	X - To 1.75 MPa (254 psi)	U - Using Aircraft
	C - Low	Y - To 1.25 MPa (181 psi)	
	D - Ultra Low	Z - To 0.5 MPa (73 psi)	

# A340-500/-600

## AIRCRAFT CHARACTERISTICS - AIRPORT AND MAINTENANCE PLANNING

Section 07-10-00 shows the aircraft ACR values.

For flexible and rigid pavements, the four subgrade categories are defined based on the subgrade modulus of elasticity (E):

A. High Strength	E = 200 MPa (29 008 psi)
B. Medium Strength	E = 120 MPa (17 405 psi)
C. Low Strength	E = 80 MPa (11 603 psi)
D. Ultra Low Strength	E = 50 MPa (7 252 psi)

### Maximum Pavement Loads (Sheet 2 of 2)

FIGURE-7-3-0-991-013-A01

**7-4-0      Landing Gear Loading on Pavement****\*\*ON A/C A340-500 A340-600**Landing Gear Loading on Pavement

1. The curves related to the landing gear loading on pavement are not given in section 07-04-00. Because the relationship between the aircraft weight, the center of gravity and the landing gear loading on the pavement is not strictly linear, it cannot be shown in chart format. But you can find in section 07-03-00 the maximum vertical and horizontal pavement loads for some critical conditions at the tire/ground interfaces for all the operational weight variants of the aircraft. For questions related to the landing gear loading on pavement, contact Airbus.

**7-5-0      Flexible Pavement Requirements - U.S. Army Corps of Engineers Design Method****\*\*ON A/C A340-500 A340-600**Flexible Pavement Requirements - US Army Corps of Engineers Design Method

1. The flexible-pavement requirements curves by U.S. Army Corps of Engineers Design Method are not given in section 07-05-00 since the related data is available through free software. Sections 07-02-00 and 07-03-00 give all the inputs data required for the use of such software.

NOTE : The U.S. Army Corps of Engineers Design Method for flexible pavements is being gradually superseded by mechanistic-empirical design methods mostly relying on Linear Elastic Analysis (LEA). The number of parameters considered by such methods is not applicable for a chart format and the use of dedicated pavement-design software is necessary.

For questions related to the flexible pavement requirements, contact Airbus.

**7-6-0      Flexible Pavement Requirements - LCN Conversion****\*\*ON A/C A340-500 A340-600**Flexible Pavement Requirements - LCN Conversion

1. The Load Classification Number (LCN) curves are no longer provided in section 07-06-00 since the LCN system for reporting pavement strength is obsolete, having been replaced by the ICAO recommended ACN/PCN system in 1983 and ACR/PCR system in 2020.  
For questions related to the LCN system, contact Airbus.

**7-7-0 Rigid Pavement Requirements - Portland Cement Association Design Method****\*\*ON A/C A340-500 A340-600**Rigid Pavement Requirements - Portland Cement Association Design Method

1. The rigid-pavement requirements curves by Portland Cement Association Design Method are not given in section 07-07-00 since the related data is available through free software. Sections 07-02-00 and 07-03-00 give all the inputs data required for the use of such software.

NOTE : The Portland Cement Association Design Method for rigid pavements is being gradually superseded by mechanistic-empirical design methods mostly relying on Finite Element Analysis (FEM). The number of parameters considered by such methods is not applicable for a chart format and the use of dedicated pavement-design software is necessary.

For questions related to the rigid pavement requirements, contact Airbus.

## 7-8-0 Rigid Pavement Requirements - LCN Conversion

### **\*\*ON A/C A340-500 A340-600**

#### Rigid Pavement Requirements - LCN Conversion

1. The Load Classification Number (LCN) curves are no longer provided in section 07-08-00 since the LCN system for reporting pavement strength is obsolete, having been replaced by the ICAO recommended ACN/PCN system in 1983 and ACR/PCR system in 2020.  
For questions related to the LCN system, contact Airbus.

**7-9-0      ACN/PCN Reporting System - Flexible and Rigid Pavements****\*\*ON A/C A340-500 A340-600**Aircraft Classification Number - Flexible and Rigid Pavements

1. This section gives data about the Aircraft Classification Number (ACN) for an aircraft gross weight in relation to a subgrade strength value for flexible and rigid pavement.

The MLG loading on pavement graphs are given for the weight variants that produce (at the MRW and maximum aft CG and standard tire pressure) the lowest ACN and the highest ACN for each type of aircraft.

To find the ACN of an aircraft on flexible and rigid pavement, you must know the aircraft gross weight and the subgrade strength.

NOTE : An aircraft with an ACN equal to or less than the reported PCN can operate on that pavement, subject to any limitation on the tire pressure.

(Ref: ICAO Aerodrome Design Manual, Part 3, Chapter 1, Second Edition 1983).

2. Aircraft Classification Number - ACN table

The tables in FIGURE 7-9-0-991-006-A and FIGURE 7-9-0-991-007-A gives ACN data in tabular format for all the operational weight variants of the aircraft.

As an approximation, use a linear interpolation in order to get the ACN at the required operating weight using the following equation:

- $ACN = ACN_{min} + (ACN_{max} - ACN_{min}) \times (\text{Operating weight} - 180\,000\text{ kg}) / (\text{MRW} - 180\,000\text{ kg})$

Please note that the interpolation error can reach 5% to 10%.

As an approximation, use a linear interpolation in order to get the aircraft weight at the pavement PCN using the following equation:

- $\text{Operating weight} = 180\,000\text{ kg} + (\text{MRW} - 180\,000\text{ kg}) \times (PCN - ACN_{min}) / (ACN_{max} - ACN_{min})$

Please note that the interpolation error can reach up to 5%.

With  $ACN_{max}$  = ACN calculated at the MRW in the table and with  $ACN_{min}$  = ACN calculated at 180 000 kg.

**7-10-0      ACR/PCR Reporting System - Flexible And Rigid Pavement****\*\*ON A/C A340-500 A340-600**ACR/PCR Reporting System - Flexible and Rigid Pavements

1. The ACR/PCR system has been developed by the ICAO to overcome the deficiencies of the ACN/PCN system. Significant advances in pavement design methods had occurred since its development in the late 1970s early 1980s, leading to inconsistencies with the pavement-strength-rating system.

The ACR/PCR system entails new procedures for the determination of both the ACR and the PCR that are consistent with the current pavement design procedures. This allows to capture the effects of the improved characteristics of new pavement materials as well as modern landing gear configurations, thus leading to an improved accuracy.

This section gives data about the Aircraft Classification Rating (ACR) for the maximum ramp weight in relation with standard subgrade strength values for flexible and rigid pavement.

To determine the ACR at other aircraft gross weight, use the official ICAO-ACR software.

NOTE : An aircraft with an ACR equal to or less than the reported PCR can operate on that pavement, subject to any limitation on the tire pressure. (Ref: ICAO Aerodrome Design Manual, Part 3, Third Edition 2020).

2. Aircraft Classification Rating - ACR Table

The table FIGURE 7-10-0-991-008-A and FIGURE 7-10-0-991-009-A give ACR data in tabular format for all the operational weight variants of the aircraft.

For questions or specific calculation related to ACR/PCR reporting system, contact Airbus.

## BRAKE OVERHEAT AND LANDING GEAR FIRE

**WARNING:** BE VERY CAREFUL WHEN THERE IS A BRAKE OVERHEAT AND/OR LANDING GEAR FIRE.  
THERE IS A RISK OF TIRE EXPLOSION AND/OR WHEEL RIM BURST THAT CAN CAUSE DEATH OR INJURY.  
MAKE SURE THAT YOU OBEY THE SAFETY PRECAUTIONS THAT FOLLOW.

THE PROCEDURES THAT FOLLOW GIVE RECOMMENDATIONS AND SAFETY PRECAUTIONS FOR THE COOLING OF VERY HOT BRAKES AFTER ABNORMAL OPERATIONS SUCH AS A REJECTED TAKE-OFF OR OVERWEIGHT LANDING.  
FOR THE COOLING OF BRAKES AFTER NORMAL TAXI-IN, REFER TO YOUR COMPANY PROCEDURES.

### BRAKE OVERHEAT:

- 1 - GET THE BRAKE TEMPERATURE FROM THE COCKPIT OR USE A REMOTE MEASUREMENT TECHNIQUE.  
**NOTE:** AT HIGH TEMPERATURES (>800°C), THERE IS A RISK OF WARPING OF THE LANDING GEAR STRUTS AND AXLES.
- 2 - APPROACH THE LANDING GEAR WITH EXTREME CAUTION AND FROM AN OBLIQUE ANGLE IN THE DIRECTION OF THE TIRE SHOULDER. DO NOT GO INTO THE RIM HAZARD AREA AND ONLY GO IN THE TIRE HAZARD AREA WITH CAUTION. (REF FIG. WHEEL/BRAKE OVERHEAT HAZARD AREAS). IF POSSIBLE, STAY IN A VEHICLE.
- 3 - LOOK AT THE CONDITION OF THE TIRES:  
IF THE TIRES ARE STILL INFLATED (FUSE PLUGS NOT MELTED), THERE IS A RISK OF TIRE EXPLOSION AND RIM BURST. DO NOT USE COOLING FANS BECAUSE THEY CAN PREVENT OPERATION OF THE FUSE PLUGS.
- 4 - USE WATER MIST TO DECREASE THE TEMPERATURE OF THE COMPLETE WHEEL AND BRAKE ASSEMBLY.  
USE A TECHNIQUE THAT PREVENTS SUDDEN COOLING. SUDDEN COOLING CAN CAUSE WHEEL CRACKS OR RIM BURST. DO NOT APPLY WATER, FOAM OR CO<sub>2</sub>. THESE COOLING AGENTS (AND ESPECIALLY CO<sub>2</sub>, WHICH HAS A VERY STRONG COOLING EFFECT) CAN CAUSE THERMAL SHOCKS AND BURST OF HOT PARTS.

### LANDING GEAR FIRE:

**CAUTION:** AIRBUS RECOMMENDS THAT YOU DO NOT USE DRY POWDERS OR DRY CHEMICALS ON HOT BRAKES OR TO EXTINGUISH LANDING GEAR FIRES. THESE AGENTS CAN CHANGE INTO SOLID OR ENAMELED DEPOSITS. THEY CAN DECREASE THE SPEED OF HEAT DISSIPATION WITH A POSSIBLE RISK OF PERMANENT STRUCTURAL DAMAGE TO THE BRAKES, WHEELS OR WHEEL AXLES.

### 1 - IMMEDIATELY STOP THE FIRE:

- A) APPROACH THE LANDING GEAR WITH EXTREME CAUTION FROM AN OBLIQUE ANGLE IN THE DIRECTION OF THE TIRE SHOULDER. DO NOT GO INTO THE RIM HAZARD AREA AND ONLY GO IN THE TIRE HAZARD AREA WITH CAUTION. IF POSSIBLE, STAY IN A VEHICLE.
- B) USE LARGE AMOUNTS OF WATER, WATER MIST; IF THE FUEL TANKS ARE AT RISK, USE FOAM.  
USE A TECHNIQUE THAT PREVENTS SUDDEN COOLING. SUDDEN COOLING CAN CAUSE WHEEL CRACKS OR RIM BURST.
- C) DO NOT USE FANS OR BLOWERS.

## BRAKE OVERHEAT AND LANDING GEAR FIRE

**WARNING:** BE VERY CAREFUL WHEN THERE IS A BRAKE OVERHEAT AND/OR LANDING GEAR FIRE.  
THERE IS A RISK OF TIRE EXPLOSION AND/OR WHEEL RIM BURST THAT CAN CAUSE DEATH OR INJURY.  
MAKE SURE THAT YOU OBEY THE SAFETY PRECAUTIONS THAT FOLLOW.

THE PROCEDURES THAT FOLLOW GIVE RECOMMENDATIONS AND SAFETY PRECAUTIONS FOR THE COOLING OF VERY HOT BRAKES AFTER ABNORMAL OPERATIONS SUCH AS A REJECTED TAKE-OFF OR OVERWEIGHT LANDING.  
FOR THE COOLING OF BRAKES AFTER NORMAL TAXI-IN, REFER TO YOUR COMPANY PROCEDURES.

### BRAKE OVERHEAT:

- 1 - GET THE BRAKE TEMPERATURE FROM THE COCKPIT OR USE A REMOTE MEASUREMENT TECHNIQUE.  
**NOTE:** AT HIGH TEMPERATURES (>800°C), THERE IS A RISK OF WARPING OF THE LANDING GEAR STRUTS AND AXLES.
- 2 - APPROACH THE LANDING GEAR WITH EXTREME CAUTION AND FROM AN OBLIQUE ANGLE IN THE DIRECTION OF THE TIRE SHOULDER. DO NOT GO INTO THE RIM HAZARD AREA AND ONLY GO IN THE TIRE HAZARD AREA WITH CAUTION. (REF FIG. WHEEL/BRAKE OVERHEAT HAZARD AREAS). IF POSSIBLE, STAY IN A VEHICLE.
- 3 - LOOK AT THE CONDITION OF THE TIRES:  
IF THE TIRES ARE STILL INFLATED (FUSE PLUGS NOT MELTED), THERE IS A RISK OF TIRE EXPLOSION AND RIM BURST. DO NOT USE COOLING FANS BECAUSE THEY CAN PREVENT OPERATION OF THE FUSE PLUGS.
- 4 - USE WATER MIST TO DECREASE THE TEMPERATURE OF THE COMPLETE WHEEL AND BRAKE ASSEMBLY.  
USE A TECHNIQUE THAT PREVENTS SUDDEN COOLING. SUDDEN COOLING CAN CAUSE WHEEL CRACKS OR RIM BURST. DO NOT APPLY WATER, FOAM OR CO<sub>2</sub>. THESE COOLING AGENTS (AND ESPECIALLY CO<sub>2</sub>, WHICH HAS A VERY STRONG COOLING EFFECT) CAN CAUSE THERMAL SHOCKS AND BURST OF HOT PARTS.

### LANDING GEAR FIRE:

**CAUTION:** AIRBUS RECOMMENDS THAT YOU DO NOT USE DRY POWDERS OR DRY CHEMICALS ON HOT BRAKES OR TO EXTINGUISH LANDING GEAR FIRES. THESE AGENTS CAN CHANGE INTO SOLID OR ENAMELED DEPOSITS. THEY CAN DECREASE THE SPEED OF HEAT DISSIPATION WITH A POSSIBLE RISK OF PERMANENT STRUCTURAL DAMAGE TO THE BRAKES, WHEELS OR WHEEL AXLES.

### 1 - IMMEDIATELY STOP THE FIRE:

- A) APPROACH THE LANDING GEAR WITH EXTREME CAUTION FROM AN OBLIQUE ANGLE IN THE DIRECTION OF THE TIRE SHOULDER. DO NOT GO INTO THE RIM HAZARD AREA AND ONLY GO IN THE TIRE HAZARD AREA WITH CAUTION. IF POSSIBLE, STAY IN A VEHICLE.
- B) USE LARGE AMOUNTS OF WATER, WATER MIST; IF THE FUEL TANKS ARE AT RISK, USE FOAM.  
USE A TECHNIQUE THAT PREVENTS SUDDEN COOLING. SUDDEN COOLING CAN CAUSE WHEEL CRACKS OR RIM BURST.
- C) DO NOT USE FANS OR BLOWERS.

## APU ACCESS DOOR

### 315AL OPERATION:

- 1 - OPERATE THE TRIGGERS.
- 2 - RELEASE THE LATCHES AND PULL THE HANDLES.
- 3 - REMOVE THE SUPPORT STRUT PIN.
- 4 - PUT THE SUPPORT STRUT AGAINST FUSELAGE AND LOCK THE DOOR IN THE OPEN POSITION WITH THE PIN.

### 316AR OPERATION:

- 1 - OPERATE THE TRIGGERS.
- 2 - LOCK THE DOOR IN OPEN POSITION WITH THE SUPPORT STRUT.
